

VibeMeGood User Guide

Your Complete, Plain-English Handbook for Winning on PrizePicks

Who this guide is for: If you've never placed a sports bet in your life, this guide is written for you. Every term is explained. Every number has a meaning. By the end, you'll understand exactly what the app is doing and why — and you'll be making smarter picks than 90% of PrizePicks players.

1. What Is VibeMeGood?

VibeMeGood is your **personal analytics workstation** for PrizePicks. Think of it like this:

Imagine you're trying to buy a used car. You *could* just walk onto a lot and trust whatever price the dealer shows you. Or you could pull up the Carfax report, check the Kelley Blue Book value, look at similar cars on three other lots, and walk in knowing exactly what the car is worth.

VibeMeGood is the Carfax report for PrizePicks. It shows you what the props are *actually* worth, compares them to what other betting sites are offering, calculates your real chances of winning, and tells you mathematically whether a play is worth making.

What it does:

- Pulls all of today's live PrizePicks props automatically
 - Compares each prop against DraftKings, FanDuel, and ESPN Bet to find hidden value
 - Calculates the real probability of each pick hitting
 - Finds the best combinations of picks using math
 - Gives you an AI analyst you can talk to like a text message
 - Tracks your results so you improve over time
-

2. What Is PrizePicks? (The Basics)

PrizePicks is a platform where you predict whether a player will score **more or less** than a set number in a stat category.

Example:

LeBron James — Points — Line: 24.5 You pick: **MORE** (Over 24.5 points) If LeBron scores 25 or more, you win that pick. 

You combine multiple picks into an **entry** (also called a lineup or slate). The more picks you add, the bigger the potential payout — but also the harder it is to win.

The two play types:

- **Power Play** — Every single pick must hit. Miss one and you lose everything. Higher payouts.
- **Flex Play** — You can miss one or two picks and still get a partial payout. Lower max payout, but safer.

Stat categories you'll see:

Sport	Common Stats
NBA	Points, Rebounds, Assists, 3-Pointers Made, Pts+Reb+Ast
MLB	Hits, Total Bases, Strikeouts, RBIs
NFL	Passing Yards, Rushing Yards, Receptions
NHL	Points (goals + assists), Shots on Goal
WNBA	Points, Rebounds, Assists

3. The Golden Rules Before You Start

Read these once, then re-read them every week.

Rule 1: Only play with money you can afford to lose completely.

PrizePicks is gambling. There is no guaranteed win. The app gives you an *edge* — a better chance — but no certainty. Never bet rent money, grocery money, or money earmarked for anything important.

Rule 2: Treat it like a business, not a thrill.

The players who make consistent money approach this calmly and methodically. They don't chase losses. They don't double up after a bad day. They follow the math.

Rule 3: Small stakes, steady habits beat big swings.

A player betting \$10/day with smart picks will outperform a player betting \$100 randomly. Consistency compounds.

Rule 4: The app helps you find edges, not guarantees.

Even a 65% probability means you lose 35% of the time. That’s 1 in 3 picks. Don’t panic when you’re right but lose.

Rule 5: Set a daily loss limit before you play.

In Settings, you can set this. If you hit it, you stop. No exceptions.

4. Tour of the App

When you open VibeMeGood, you’ll see a **dark sidebar on the left** with five sections. Here’s what each one does in one sentence:

Page	What It Does
 Live Slate	Shows every prop available on PrizePicks right now, with analysis
 Optimizer	Automatically finds the best lineup combinations using math
 Entry Builder	Where you review your picks and see your potential payout
 AI Analyst	Chat with an AI that knows today’s entire slate
 Settings	Configure your bankroll, assumptions, and preferences

At the bottom of the sidebar you’ll always see:

- A green/yellow/red dot showing if the live data is loaded
- Your current bankroll and unit size (explained later)
- A mini-preview of your current entry

5. The Live Slate — Your Starting Point

The **Live Slate** is where you spend most of your time. It’s a table showing every prop PrizePicks is offering today, updated in real time.

The Filters (Top of the page)

Sport tabs: Click NBA, MLB, NHL, etc. to see only that sport. Click ALL to see everything.

Line type filters:

- **All Types** — See everything
-  **Goblin** — Only the discounted lines (explained below — these are usually the best plays)
-  **Demon** — Only the inflated lines
- **Standard** — Normal lines

Stat type dropdown: Filter to only see “Points” or only “Total Bases,” etc.

Search box: Type a player’s name to find them instantly.

The Columns Explained

Column	What It Means	What to Look For
PLAYER	The athlete’s name and today’s matchup	—
TEAM	Their team abbreviation	—
SPORT	Which sport	—
STAT	What you’re predicting (Points, Hits, etc.)	—
PP LINE	The number PrizePicks set. You predict more or less than this.	The big cyan number
TYPE	Standard, Goblin, or Demon (see Section 6)	Goblins =  good. Demons OVER =  bad
MKT AVG	What DraftKings/FanDuel/ESPN Bet think the line should be	Compare to PP Line
TRUE EDGE	How much better or worse PP’s line is vs the market	Green = value. Red = trap.
HIT PROB	Our calculated probability this pick hits	Higher % = safer pick
YOUR PROJ	A box where you can type your own projection	Optional — improves accuracy if you track stats

+ ADD button	Adds this pick to your entry	Click to select
-----------------	------------------------------	-----------------

How to Read a Row

Let's walk through an example:

Anthony Davis | LAL | NBA | Points | PP Line: **26.5** | Type: STD | Mkt Avg: **28.5** | True Edge: **+7.6%** | Hit Prob: **58%**

What this tells you:

- PrizePicks has Davis's points line at 26.5
- DraftKings/FanDuel average is 28.5 — that's 2 full points higher
- This means PrizePicks is offering a **softer line** than the market
- The True Edge of +7.6% means the OVER has real value
- There's a 58% calculated chance the OVER hits

Decision: This is a PLAY — the market says 28.5, PP is giving you 26.5. That's two free points.

6. Understanding Line Types: Standard, Goblin, and Demon

This is one of the most important concepts in the app.

Standard Lines

These are normal lines set close to what PrizePicks thinks the player will actually do. Think of it like a coin flip — roughly 50/50 whether you win.

When to play: When the True Edge is positive (market line is higher than PP line).

Goblin Lines

A **Goblin line** is set *lower* than normal — PrizePicks is essentially giving you a discount. The line is easier to beat.

Analogy: Imagine a hotdog normally costs \$5, but today it's \$3. Same hotdog, lower price. That's a Goblin line — you're getting the same player at an easier number.

Hit rate: Approximately 65% of Goblin OVER picks hit, compared to ~50% for standard lines.

When to play: Almost always. Goblin lines are your best friends for Power Plays where you need every pick to hit.

The catch: PrizePicks pays you less when you hit a Goblin (the multiplier is lower). But the math still works in your favor because you hit more often.

Demon Lines 🐈

A **Demon line** is set *higher* than normal — PrizePicks is making the number harder to beat on the OVER.

Analogy: That same hotdog is now \$9. You're paying too much. The Demon line is overpriced.

NEVER play Demon OVER. The hit rate on Demon OVER picks is only about 35%. You will lose more than you win.

BUT — here's the secret: Demon lines played as **UNDER** are excellent plays. If the line is set too high, then the UNDER (scoring less than that inflated number) becomes favorable. Hit rate on Demon UNDER picks is approximately 65%.

The app's Demon Under strategy in the Optimizer specifically finds these plays for you.

7. Edge Score and True Edge — Your Compass

True Edge %

This is the most important number in the app. It tells you how much better or worse PP's line is compared to DraftKings, FanDuel, and ESPN Bet.

Formula: $\text{True Edge} = (\text{Market Line} - \text{PP Line}) / \text{Market Line} \times 100$

Reading it:

- **Positive True Edge (green)** = PP's line is lower than the market → OVER has value
- **Negative True Edge (red)** = PP's line is higher than the market → Skip or consider UNDER
- **Zero** = PP and the market agree → No edge either way

Examples:

PP Line	Market Line	True Edge	Meaning
24.5	27.5	+10.9%	🔥 Strong OVER value
28.5	28.5	0%	Neutral, no edge
32.5	29.5	-10.2%	⚠️ OVER is a trap

Why does this matter?

The betting market (DK/FD/ESPN) has billions of dollars and teams of analysts setting lines. When PrizePicks disagrees with that consensus, it's usually PrizePicks that's wrong — and *that's where your profit comes from.*

8. Hit Probability — Your Reality Check

Every pick in the app shows a **Hit Probability** percentage. This is our calculated chance that pick will go OVER (or UNDER if you chose that direction).

How it's calculated:

- Goblin line OVER → ~65% base rate
- Standard line with strong market edge → ~58%
- Standard line, neutral → ~52%
- Standard line, against you → ~47%
- Demon line UNDER → ~65% base rate
- Demon line OVER → ~35% (terrible)

What it means for your entry:

If you're building a 4-pick Power Play, your probability of winning *all four* is:

$$P(\text{win}) = \text{Pick1\%} \times \text{Pick2\%} \times \text{Pick3\%} \times \text{Pick4\%}$$

Example with all Goblin picks (65% each):

$$0.65 \times 0.65 \times 0.65 \times 0.65 = \mathbf{17.9\% \text{ chance of winning all 4}}$$

Example with mixed picks (58%, 65%, 52%, 58%):

$$0.58 \times 0.65 \times 0.52 \times 0.58 = \mathbf{11.4\% \text{ chance}}$$

This is why pick quality matters so much. Every weak pick dramatically lowers your overall win probability.

In the **Entry Builder**, you'll see the full probability chain showing exactly this math in real time.

9. Market Lines — What the Sharp Books Say

The **Market Lines** panel (the 🔍 Market Intel view in the Slate Board) shows how PrizePicks compares to three major books:

- **DK** = DraftKings
- **FD** = FanDuel
- **ESPN** = ESPN Bet

These books have enormous resources and set very accurate lines. When their lines differ from PrizePicks, that gap is your opportunity.

Green rows = PP line is softer (lower) than the market → OVER value **Red rows** = PP line is harder (higher) than the market → Skip or play UNDER

Think of it like comparing prices on Amazon vs. Best Buy. If Best Buy sells a TV for \$800 but Amazon has the same TV for \$600, you buy from Amazon. When PrizePicks "sells" you a player at a lower line than other books, that's your edge.

10. The Lineup Optimizer — Let the Math Work

The **Optimizer** (⚡ in the sidebar) automatically searches hundreds or thousands of pick combinations and finds the ones with the highest Expected Value.

How to Use It

Step 1: Choose a Strategy

Strategy	Best For	How It Works
 Goblin Hunter	Beginners, conservative players	Only uses Goblin lines on OVER. Maximizes hit rate.

 Demon Under	Experienced players	Only uses Demon lines on UNDER. Hidden gem plays.
 Balanced Value	Everyday play	Mix of Goblin + Standard lines with positive True Edge
 Max EV	Sharp players	Finds the highest mathematical Expected Value, any line type

Recommendation for beginners: Start with **Goblin Hunter**. It's the safest strategy and teaches you how goblin lines work.

Step 2: Choose Number of Picks

- **2–3 picks:** Safest, lowest payout (3×–6×)
- **4 picks:** Sweet spot (10× payout, manageable probability)
- **5–6 picks:** High risk, high reward (20×–40×)

Recommendation: Start with **4 picks** until you understand the math.

Step 3: Choose Power or Flex

- **Power** = All picks must hit. Higher payout.
- **Flex** = Can miss one. Lower payout but partial insurance.

Recommendation for beginners: Start with **Flex** until your hit rates improve.

Step 4: Set Your Stake Start small. \$10–\$25. You're learning.

Step 5: Click "Run Optimizer"

The app will return up to 10 lineup combinations, ranked by Expected Value. Each shows:

- The picks (player, stat, line, direction, hit probability)
- Combined win probability
- Potential payout
- Expected Value (positive = mathematically profitable)
- Kelly-recommended stake

Step 6: Review and Load Click "**→ Load into Entry Builder**" on any combination you like. It will automatically populate your entry with the right picks and directions.

11. The Entry Builder — Building Your Lineup

The **Entry Builder** ( in the sidebar) is where you finalize your picks before playing.

What You'll See

Your Active Picks — The left panel shows every pick you've selected. For each pick you can:

- Set the direction: **▲ OVER** or **▼ UNDER**
- See the hit probability for that specific direction
- See the market edge
- Remove it with the × button

The Payout Calculator — The right panel shows:

- Your stake
- Power vs. Flex toggle
- Potential payout amount

The EV Panel — When you have 2+ picks, this shows:

- **Win Probability** — The math says you'll win X% of the time
- **Expected Value** — If positive, the entry is mathematically profitable over time
- **ROI** — Return on investment percentage
- **Probability Chain** — Each pick's probability multiplied together
- **Kelly Recommendation** — How much the math says to bet (see Section 14)

The Stack Warning

If you pick two players from the same NBA or WNBA team, you'll see a **yellow warning**. This is important: teammates share the same stat pool. If the game is low-scoring, both might fall short. Avoid stacking teammates in basketball.

12. Power vs. Flex Plays Explained

Power Play 

You must hit every single pick.

Picks	Payout Multiplier
2 picks	3× your stake
3 picks	6× your stake
4 picks	10× your stake
5 picks	20× your stake
6 picks	40× your stake

Example: \$25 on a 4-pick Power = win \$250 if all 4 hit.

Best for: When you have high-confidence, high-probability picks (Goblins, strong True Edge).

Flex Play 🌊

You can miss one or two picks and still get paid.

Picks	5-pick Flex Payouts
Hit 5/5	20× stake
Hit 4/5	4× stake
Hit 3/5	1× stake (break even)
Hit 2/5 or less	Lose

Best for: When you're less certain, or when you want insurance on one risky pick.

The trade-off: Lower maximum payout, but you have a cushion if one pick misses.

Quick rule of thumb: If your win probability is under 10%, go Flex. If it's over 15%, Power is better mathematically.

13. Expected Value (EV) — The Most Important Number

Expected Value (EV) is the single most important concept in this entire app. Understanding

it separates consistent winners from recreational players.

What Is EV?

EV tells you **how much you'll profit (or lose) on average** if you made the same bet over and over again hundreds of times.

Positive EV (+EV): You'll profit over time. The play is mathematically good. **Negative EV (-EV):** You'll lose over time. The play is mathematically bad. **Zero EV:** Break even over time.

The Simple Calculation

$$EV = (\text{Probability of Winning} \times \text{Payout}) - (\text{Probability of Losing} \times \text{Stake})$$

Example — 4-pick Goblin Power at \$25:

- Win probability: 17.9% (as calculated above)
- Payout if win: \$250
- Stake: \$25

$$EV = (0.179 \times \$250) - (0.821 \times \$25) \quad EV = \$44.75 - \$20.53 \quad \mathbf{EV = +\$24.22}$$

This means on average, every time you make this play, you profit \$24.22. That's a 97% ROI. Over 100 plays at \$25 each, you'd expect to profit ~\$2,422.

This is why Goblin lines are so powerful. The higher hit rate tips the math in your favor.

A Negative EV Example

4-pick all-standard Power at \$25 (50% pick hit rate):

- Win probability: $0.5^4 = 6.25\%$
- Payout: \$250

$$EV = (0.0625 \times \$250) - (0.9375 \times \$25) \quad EV = \$15.63 - \$23.44 \quad \mathbf{EV = -\$7.81}$$

This entry loses \$7.81 on average every time. Over 100 plays, you'd expect to lose \$781.

This is why most PrizePicks players lose. They play standard lines without checking the math.

14. Kelly Criterion — How Much to Bet

The **Kelly Criterion** is a mathematical formula used by professional gamblers and investors

to determine the optimal bet size. The app calculates this for you automatically.

The Simple Explanation

Imagine you have \$500 in your bankroll. Kelly tells you exactly what percentage to bet on any given play based on your edge and odds.

Why not just bet \$25 every time?

- If you bet too small, you don't grow fast enough.
- If you bet too large, one bad streak wipes out your bankroll.
- Kelly finds the mathematically optimal middle ground.

What the App Shows

In the Entry Builder, you'll see: **"Kelly recommends: \$12.50"**

This means the math says to bet \$12.50 on this entry. If you bet more, you're being aggressive. Less, and you're being conservative.

Kelly Fraction (In Settings)

The app defaults to **Quarter Kelly (0.25)** — meaning we recommend betting 25% of whatever pure Kelly suggests. Why?

Because pure Kelly assumes you know the exact probabilities, which you don't — they're estimates. Quarter Kelly is the professional standard. It's more conservative and protects you from overbet errors.

As a beginner: Keep Kelly Fraction at 0.25. **As you get experienced and track more results:** You can slowly increase it.

15. The AI Analyst — Your Personal Scout

The **AI Analyst** ( in the sidebar) is powered by Claude, an advanced AI. Think of it as having a sports analytics expert on speed dial.

What You Can Ask It

About specific picks:

- "Is Anthony Davis's points line good value today?"
- "Should I take the over or under on Shohei Ohtani's total bases?"

- "Explain why Aaron Judge is flagged as a PLAY"

About building lineups:

- "What's the best 4-pick power play today?"
- "Build me a Goblin Hunter lineup under \$25"
- "Which demon UNDER plays are available?"

About strategy:

- "Explain what a Demon Under play is"
- "Is Power or Flex better for a 4-pick entry today?"
- "My picks are [X, Y, Z] — are they correlated?"

About your current entry:

- "Analyze my current entry" (the AI sees your picks automatically)
- "What's the weakest pick in my lineup?"
- "Should I swap out [player] for someone else?"

Quick Prompt Buttons

Below the chat, you'll see pre-set questions you can tap with one click:

- "Best goblin plays today?"
- "Top demon UNDER opportunities?"
- "Build me a 4-pick power play with highest EV"
- And more

Tips for Getting Great Answers

- Be specific: "Should I take Davis OVER 26.5 points tonight against OKC?" is better than "Is Davis good?"
- Give context: "I'm building a \$25 4-pick power play focused on high hit rate"
- Ask follow-ups: "Why is that pick better than [other player]?"

16. Injuries & News — Never Get Caught Sleeping

The **Injuries & News** page is critical. One late scratch can turn a great entry into a losing one.

What You'll See

Injury Reports: Players with recent injury designations, color-coded by severity:

-  **OUT** — Do not play any prop for this player. Period.
-  **GTD (Game-Time Decision)** — Wait until confirmed before playing. If lineup confirmation hasn't posted, skip.
-  **ACTIVE** — Cleared to play.

Lineup Confirmations: Shows which players are confirmed starters and their expected minutes/role.

The Most Important Habit

Check the Injuries page **within 30 minutes of game time** for any player you're picking. A player who is starting 15 fewer minutes due to a "coach's decision" makes your over pick much harder to hit.

Quick rule: If a player is GTD and you haven't seen lineup confirmation, do NOT include them in a Power Play. Put them in Flex at most, so a potential scratch doesn't ruin your entire entry.

17. Performance Review — Learning From Your History

The **Performance Review** page tracks every entry you've logged. This is how you improve over time.

Key Metrics to Watch

Metric	What It Means	What's Good
Total P&L	Total profit or loss in dollars	Positive and growing
Entry Hit Rate	% of entries you won	Above 25% for 4-pick power
Pick Hit Rate	% of individual picks that hit	Above 55%

Avg CLV	Closing Line Value — did lines move in your favor?	Positive means your process is good
ROI	Return on investment %	Positive long-term

Closing Line Value (CLV) — The Professional Standard

CLV measures whether the lines moved in your favor *after* you locked in your pick.

If you pick Davis OVER 26.5 and the line later moves to 27.5, your CLV is +1.0. You got a better price than the final market.

Consistent positive CLV means your process is good, even during losing stretches. It's the most reliable proof that your edge is real, not just luck.

18. Settings — Tuning Your Tools

The **Settings** page () is where you configure everything that drives the math. Here's what each section means and when to change it:

Bankroll Management

Setting	What It Does	Starting Value
Current Bankroll	Total \$ available for PrizePicks	Whatever you deposit
Unit Size	Your default bet per entry	3–5% of bankroll
Kelly Fraction	How aggressive Kelly sizing is	0.25 (quarter Kelly)
Max Units Per Entry	Hard cap on any single bet	1 unit to start

Example: \$500 bankroll → \$25 unit size (5%) → Max \$25 per entry.

Hit Rate Assumptions

These numbers drive every probability calculation in the app. They start with research-backed defaults. As you track more results, update these to reflect your **actual** personal hit rates.

Line Type + Direction	Default	Update When

Goblin OVER	65%	After 50+ goblin picks
Standard (high edge)	58%	After 100+ standard picks
Standard (neutral)	52%	After 100+ standard picks
Demon UNDER	65%	After 30+ demon under picks
Demon OVER	35%	Never change — always avoid

Payout Config

PrizePicks occasionally adjusts their payout multipliers. If you ever notice a pick payout that doesn't match what's in the app, update it here. Everything recalculates automatically.

Edge Score Weights

Weight	Default	Adjust When
Market Gap	60%	You trust market lines a lot → increase
Line Type	25%	—
Your Projection	15%	You enter your own projections → increase

Sharp Player Switches

- **Min Edge to Flag as PLAY:** Raise this to be more selective (e.g., only flag plays with 5%+ true edge)
- **Exclude Demon OVER lines:** Turn ON as a beginner. Removes the trap plays from your optimizer.
- **AI Model:** Sonnet is smarter; Haiku is cheaper. Start with Sonnet.

19. Bankroll Management 101

This section could save your entire PrizePicks career. More players quit because of poor bankroll management than poor picks.

The Core Rules

Rule 1: Never risk more than 5% of your bankroll on any single entry. If you have \$500,

max entry is \$25. If you have \$100, max entry is \$5.

Rule 2: Set a daily loss limit before you play. Decide: "If I lose \$X today, I stop." Stick to it. No exceptions. Tilt (emotional betting after losses) is the #1 killer of bankrolls.

Rule 3: Don't increase stakes after wins. Let the bankroll grow slowly. Doubling your stakes after a win "to celebrate" usually gives it all back.

Rule 4: Keep records of everything. The app does this for you — but you have to log your entries. Without data, you're flying blind.

Rule 5: Give yourself at least 200 entries before judging your results. Variance is brutal in the short term. A player with a real edge can have a terrible 30-entry stretch. The math needs volume to play out.

Sample Bankroll Progression

Bankroll	Unit Size (5%)	Entries/Day	After 30 Days (at +20% ROI)
\$100	\$5	1–2	~\$130
\$250	\$12.50	1–2	~\$325
\$500	\$25	2–3	~\$650
\$1,000	\$50	2–3	~\$1,300

20. Common Mistakes and How to Avoid Them

✗ Mistake 1: Playing Demon OVER lines

Why: 35% hit rate. You lose 65% of the time. **Fix:** Filter the Slate Board to hide Demons. Use the Optimizer's Goblin Hunter strategy.

✗ Mistake 2: Stacking NBA teammates

Why: In basketball, if two players on the same team are both scoring a lot, that means other teammates are scoring less — they share the pie. **Fix:** The app warns you automatically. Heed the warning.

✗ Mistake 3: Ignoring injuries and playing a GTD player in a Power Play

Why: If they scratch and you're in a Power Play, you lose everything. **Fix:** Check the Injuries

page 30 minutes before tip-off. Never put a GTD player in a Power Play.

❌ **Mistake 4: Playing on “gut feeling” without checking the numbers**

Why: Your gut doesn’t know what DraftKings is pricing the line at. **Fix:** Always check the True Edge column before adding any pick.

❌ **Mistake 5: Chasing losses by increasing stake**

Why: Tilt leads to bigger bets, which leads to bigger losses. **Fix:** Set a daily loss limit in Settings. When you hit it, close the app.

❌ **Mistake 6: Playing too many picks in a Power Play**

Why: A 6-pick Power Play with 60% picks has only a 4.7% win rate. You’ll wait a long time. **Fix:** Stick to 3–4 pick entries unless the math specifically says 5–6 is better.

❌ **Mistake 7: Ignoring line movement**

Why: If the line moved from 24.5 to 26.5 after you planned to play it, the market is saying something. Sharp money pushed that line. **Fix:** Check the line move column. Avoid plays where the line moved significantly against you.

21. Glossary — Every Term Explained

Bankroll: The total amount of money you’ve set aside specifically for PrizePicks. Never your total savings — only money you can afford to lose.

CLV (Closing Line Value): How much the line moved between when you picked it and when the game started. Positive CLV = you got a better price than the final market. The professional standard for measuring edge quality.

Correlation: When two picks affect each other. Positive correlation = they tend to go OVER together. Negative correlation = when one does well, the other often doesn’t. Example: Two NBA teammates are negatively correlated for scoring — they share stats.

Demon Line 🐱: A PrizePicks line set higher than the market consensus. The OVER is a trap; the UNDER has value.

Edge: Your mathematical advantage over PrizePicks. Measured as a percentage. Positive edge = you expect to profit. Negative edge = you expect to lose.

Entry: Your full lineup of picks submitted to PrizePicks.

EV (Expected Value): How much you'll win or lose on average per bet if you made it hundreds of times. Positive EV = profitable strategy. Always seek positive EV.

Flex Play: An entry type where you can miss one or two picks and still receive a partial payout. Lower max payout, but safer than Power.

Goblin Line 🧛: A PrizePicks line set lower than the market consensus. The OVER has value and hits approximately 65% of the time.

Hit Rate: How often a specific type of pick wins. Goblin OVER $\approx$ 65%, Standard $\approx$ 52%, Demon OVER $\approx$ 35%.

Kelly Criterion: A mathematical formula that calculates the optimal bet size based on your edge and the payout odds. The app calculates this automatically.

Kelly Fraction: How aggressively you follow the Kelly formula. 1.0 = full Kelly (aggressive). 0.25 = quarter Kelly (conservative, recommended for beginners).

Line: The number PrizePicks sets for a player in a given stat. You predict if the player goes over or under this number.

Line Movement: When the line changes between when it's posted and game time. Lines moving up = more people or sharp money is on OVER. Lines moving down = action is on UNDER.

Market Line: The average line across DraftKings, FanDuel, and ESPN Bet. Used to determine True Edge.

More/Over: Predicting the player will exceed the set line.

Less/Under: Predicting the player will fall short of the set line.

P&L: Profit and Loss. Your total winnings minus your total losses.

Pick: A single prediction (one player, one stat, one direction — OVER or UNDER).

Power Play: An entry type where every single pick must hit to win. Higher payouts than Flex.

Prop: Short for "proposition bet." Each player/stat/line combination is a "prop."

ROI (Return on Investment): Your total profit divided by your total amount wagered, as a percentage. Positive ROI = profitable.

Sharp: A sophisticated, mathematically-driven bettor who focuses on finding edge rather than gut feelings.

Slate: The full set of props available on PrizePicks for a given day.

Stack: Picking two or more players from the same team in the same game. Generally negative in basketball (they share stats), potentially positive in baseball (lineup correlation).

Standard Line: A normal PrizePicks line, set close to the expected outcome. Not discounted (Goblin) or inflated (Demon).

True Edge: The percentage difference between PP's line and the market average. Positive = OVER value. Negative = UNDER value or skip.

Unit: Your standard bet size, usually 3–5% of your bankroll. Betting in units keeps you disciplined.

Variance: The natural randomness in outcomes. Even a play with 70% probability loses 30% of the time. Short-term results can look bad even when your process is correct.

Quick Reference Cheat Sheet

Situation	Action
Goblin line OVER	✅ Play — 65% hit rate
Demon line OVER	❌ Skip — 35% hit rate
Demon line UNDER	✅ Play — 65% hit rate
True Edge > +5%	✅ Strong play
True Edge 0–5%	⚠️ Weak play — only with other factors
True Edge negative	❌ Skip or play UNDER
Player is GTD	⚠️ Flex only, not Power
Player is OUT	❌ Never play
Teammates stacked (NBA)	⚠️ Warning — avoid if possible
Line moved against you	⚠️ Be cautious — sharp money disagrees
EV is positive	✅ Mathematically sound play
EV is negative	❌ Bad play long-term, even if it “feels right”
